The affair proved to be the greatest financial success in many years and the entertainment program was enjoyed by nearly 150 persons. The dinner was served by members of St. James' Church.

A state document which filled nearly a newspaper column is referred to as a curt note. The writer thereof certainly would have furnished some quantity of reading matter if he had prepared a real letter on the subject under consideration.

How, What, and Why

Answers to questions of general interest are printed in this column; but if you enclose a self-addressed, stamped envelope, and mention the name of this paper, you will receive a direct reply to your query. Address questions to How, What, and Why, Room 201, Roberts Hall, Ithaca, New York.

Cutting Timothy Hay

E. L. R., asks: "When is the best time to cut timothy hay?"
Professor E. VanAlstine of the agronomy department replies: "If the hay crop is short, timothy should be cut for hay when it is in full bloom or after it has passed the blossoming stage. This gives more hay but less feeding value to the acre than when timothy is cut before it blossoms."

"If the hay crop is heavy, it is better to cut timothy before it begins to blossom. This gives a smaller yield, but a much better quality of hay."

Tonics for Stock

L.L.M. writes: "Do you have information on any tonics for stock which are on the market today? Are they reliable, and do they benefit the stock?"
C. H. Crawford of the department of animal husbandry answers: "Every year farmers spend thousands of dollars for stock tonics to dose their cattle. Most of these patent medicine cure-alls are designed to aid in all common diseases and are not adapted to cure any specific disease."

How Much Water

S. E. N., writes: "How much water must be applied to land to do a good job of irrigating? What will it cost?"
Professor A. M. Goodman of the department of agricultural engi-

neering replies:

"Experience has shown that water equivalent to an inch of rainfall must be applied once a week. On one acre this means about 27,152 gallons of water, or a little more than 113 tons."

"If this amount of water is applied to an acre of land in ten hours, it must go at forty-five and one-half gallons a minute. If the water has to be pumped, the cost depends on the height it must be lifted, the length and size of the pipe through which the water is forced, and the manner it is distributed on the field."

"Every time an inch of water is applied to an acre of land, 113 tons of water must be taken from the source and distributed on the field. The power required to do this work may range from one to two or three horsepower, depending on conditions."

"These facts are not given to show that irrigation is undesirable, but merely to give a rough idea of the problem, and to indicate the importance of having an adequate water supply close to the field and not too far below it."

BLANKS MAILED FOR EATING PLACES HERE

The application blanks for renewal of the licensed beer restaurants, which will now be known as "eating places," have been mailed to licensed holders here, it is announced by the County ABC Board Office.

Grocery stores selling beer received their renewal forms several days ago. All must be filed by July 1, the renewal date. After the applications, accompanied by pictures, are received from the State, the county boards will determine their eligibility.

"Of the thirteen different brands of stock tonic, only five gave a list of their ingredients. Acid phosphate and nitrate of soda, both fertilizers, were included in these drugs."

"I am not definitely opposed to all stock tonics, but most of them do not meet our needs and I can not recommend their use. Specific treatment and diagnosis often call for the skill of a veterinarian."
